Press release

New ergonomic joystick from Stoll

For the first time, the press button functions may be chosen freely.

Hands are not always equal. Nevertheless, all operators who work with a frontloader, want to handle the joystick comfortably and also want to work with the functions easily. With the existing standardized solutions you only find a compromise between ergonomics and handling.

With the new joystick, the Stoll engineers have gone a completely different way as it does not only supply an ergonomic shape and different handling angles. Also with the keyboard layout, for the first time an individual flexibility is gained. The different press buttons are arranged as desired by the operator. Maximum 5 press buttons serve for the functions of the loader. So, the operator of the frontloader and the tractor can manage loading works easily. This enables a relaxed and safe work as the operation does not need to change the position of the hand to reach the buttons as the buttons are individually adapted to the operator's needs. Nothing is more easy!

The new joystick is suitable for all frontloaders with EcoPro system and can be retrofitted to the tractor-own control unit. The position in the cabin of the tractor can be chosen freely and corresponds to the requirements of the operator.
